

ABSTRACT OF THE DISCLOSURE

The reversible magnetic ratcheting spud wrench is a spud wrench having a ratcheting head in place of the typical open-ended U-shaped wrench head. The combination ratcheting spud wrench eliminates the need for a construction worker to use a separate ratchet wrench for securing bolts in the bolt holes of interconnecting steel beams after the bolt holes have been aligned by the spud wrench. The ratcheting spud wrench also includes a milled slot along the handle of the wrench having a magnetic strip disposed in the slot. The magnetic strip allows the wrench to be placed on one of the steel structural beams when it is not being used without having the wrench drop from the work place.
